

BirdAway Bird Hazing Device

Discourage birds from roosting on utility poles, towers, street lights, and other structures

Birds often populate utility poles, transmission towers, street lights, buildings, and structures. They also "stream" (leave droppings) as they come and go from these locations. The droppings are very toxic, presenting a significant health hazard, and make tower climbing more dangerous.

Perhaps worst of all, bird droppings are conductive. Electrical systems can short out when insulators are coated with droppings, knocking large numbers of subscribers off line at a very real cost to utilities.

There are also locations where droppings pose a nuisance or hazard on pedestrian walkways.

Application

The BirdAway bird hazing device mounts to structures directly in the line-of-sight of the birds to be hazed. It spins, reflects by day, and glows at night to bother birds into moving to another location. Sometimes it takes a few days or weeks to effectively "nag" birds into leaving a structure.

Features

The BirdAway consists of a white molded plastic weather vane that spins in light wind. Each side of the weather vane has highly reflective florescent orange and yellow tape, as well as phosphorescent tape that glows up to 10 hours after dusk. The BirdAway spinner is mounted around ball bearings on a rigid stainless steel shaft.

BirdAway installs on rounded pipe up to 2 inches in diameter. Installation on other structures is left to the user to implement.
